🌱 SOILS MISCELLANEOUS — FULL MIND MAP

Topic-wise · Fully Explained · Hinglish · SSC / BPSC / BSSC / Railway

📑 Topics in this chapter:

1. Soil-State Match Set (Alluvial-UP, Black-Maharashtra)
2. Western Rajasthan Soils — High Calcium Content
3. Nitrogen-Enriching Crops — Legumes (Pea)
4. Soil Fertility Improvement — Black Gram (Urd)
5. Red Soil — Ferric Oxide Colour
6. Red Soil Rank — 3rd Largest (Not 2nd)
7. Zinc — Most Deficient Micronutrient
8. Himalayan Soils — Humus-Poor (Assertion-Reason Trap)
9. Karewas — Kashmir Himalaya (Not Garhwal/Nepal)
10. Soil Water Availability — Clay Soil Highest
11. Particle Size Classification (Clay/Silt/Sand)
12. Matasi Soil — Chhattisgarh's Altitude Position

1. Soil-State Match Set (Alluvial-UP, Black-Maharashtra)

- Soil-state match: **Alluvial — Uttar Pradesh, Black — Maharashtra, Red — Andhra Pradesh, Desert — Rajasthan**. *[Q1]*

2. Western Rajasthan Soils — High Calcium Content

- Western Rajasthan (Jaisalmer, Bikaner, Barmer, Jalore, Jodhpur etc.) ki soil **alkaline aur saline hai, calcareous base ke saath — Calcium content zyada hai** (Aluminum, Nitrogen, Phosphorus se zyada nahi). *[Q2]*

3. Nitrogen-Enriching Crops — Legumes (Pea)

- Legume crops **atmospheric nitrogen-fixation se soil mein nitrogen enrich karti hain — Pea (matar) is category mein hai (clover, soybean, alfalfa, peanut bhi)** — Potato, Sorghum, Sunflower NAHI. *[Q3]*

4. Soil Fertility Improvement — Black Gram (Urd)

- Soil fertility improve karne ke liye **Black Gram (Urd)** ugaya jaata hai — Wheat, Rice, Sugarcane se nahi (Urd occasionally fodder ke roop mein bhi use hota hai). *[Q4]*

5. Red Soil — Ferric Oxide Colour

- Red soil **ancient crystalline igneous aur metamorphic rocks ke weathering** se bani hai — **lime, phosphates, nitrogen, humus ki kami, potash mein rich**, chemically siliceous-aluminous. Iska red color **ferric oxide** ki presence se hai. *[Q5]*

6. Red Soil Rank — 3rd Largest (Not 2nd)

- Red soil India ka **2nd sabse bada soil group NAHI hai — asal mein 3rd sabse bada hai (Alluvial ke baad)** (Assertion galat) — lekin **Red soil, Black soil ko south/east/north se surround karti hai (Reason sahi hai)**

— Red soil ~10.6% area cover karti hai (Western TN, Karnataka, NE AP, S Maharashtra, Rajasthan, E MP, Bihar, WB, Chhattisgarh, Telangana, Odisha, Chotanagpur Plateau). *[Q6]*

⚠ EXAM TRAP — Red soil 2nd sabse bada group NAHI hai — 3rd hai; Reason (Black soil ko surround karna) sahi hai

7. Zinc — Most Deficient Micronutrient

- Indian soils mein **Zinc sabse zyada deficient micronutrient** hai — Copper, Iron, Manganese se zyada. *[Q7]*

8. Himalayan Soils — Humus-Poor (Assertion-Reason Trap)

- Himalayan soils humus se rich NAHI hain (Assertion galat) — kyunki **Himalaya mein forest cover ka sabse bada area hone ke bawajood soil mein humus ki kami hoti hai (Reason sahi hai)**. *[Q8]*

9. Karewas — Kashmir Himalaya (Not Garhwal/Nepal)

- Karewa soil (Zafran/saffron cultivation ke liye) **Kashmir Himalaya** mein milti hai — Garhwal, Nepal, Eastern Himalaya mein NAHI. *[Q9]*

10. Soil Water Availability — Clay Soil Highest

- Plants ke liye available soil water **Clay soil mein maximum** hota hai (highest water retention capacity) — **Clay: <50% silt, 50% clay, kuch sand — air ventilation slow karta hai isliye water sustain hota hai**. *[Q10]*

11. Particle Size Classification (Clay/Silt/Sand)

- Particle diameter classification: **Clay — <0.002mm, Silt — 0.002-0.05mm, Fine sand — 0.05-2mm**. *[Q11]*

12. Matasi Soil — Chhattisgarh's Altitude Position

- Matasi soil (Chhattisgarh ka 55-60% area cover karti hai, red-yellow color, paddy cultivation ke liye prime) — **Bhata soil se kam ऊंchai par aur Kanhar soil se zyada ऊंchai par milti hai (galat statement — asal mein Bhata se LOWER aur Kanhar se HIGHER hai)**, Iron oxide sabse abundant element hai. *[Q12]*
