

NATURAL REGIONS OF INDIA — FULL MIND MAP

Topic-wise · Fully Explained · Hinglish · SSC / BPSC / BSSC / Railway

Topics in this chapter:

1. Origin — Gondwana, Plate Movement & the 4 Natural Regions
2. Deccan Traps & Rock-System Timeline
3. Landform Formation — Synclinorium, Foredeep & Plate Theory
4. Coastline, Geological Rock Ages & Miscellaneous Facts
5. Region-Specific Features (Uttarakhand, Bihar, Kerala, Thar Desert)

1. Origin — Gondwana, Plate Movement & the 4 Natural Regions

- Paleomagnetic results ke mutabik Indian landmass **northward** khisak gaya tha — continental drift theory ke hisaab se ye **Gondwana Continent** ka hissa tha jo ~200 million saal pehle toot gaya (aaj ke Africa, South America, Australia, Antarctica, Peninsular India, Arabian Peninsula ban gaye). [Q1, Q2]
- India ko **4 natural regions** mein baanta gaya hai: (i) **Northern Mountainous Region** (ii) **Northern Plains** (iii) **Peninsular Plateau** (iv) **Coasts and Islands**. [Q3]
- Himalaya ka formation **Indian aur Eurasian plate ke collision** se hua — 'Chinese plate' wali koi triangular convergence theory nahi hoti (ye ek common wrong-statement trap hai). [Q6]

2. Deccan Traps & Rock-System Timeline

- Deccan Traps Mesozoic era ke Cretaceous period mein Western Central India mein bane the. **Intertrappean beds mein marine fossils NAHI** milte (ye ek galat-paired option hota hai). [Q4]
- Origin-timeline match karo: **Deccan Traps — Cretaceous Eocene, Western Ghats — Late Cenozoic, Aravalli — Pre-Cambrian (sabse purana), Narmada-Tapi alluvial deposits — Pleistocene**. [Q8]
- India ke rock-systems ka classification (Sir T.S. Holland, Geological Survey of India) hai: **Archaean → Purana → Dravidian → Aryan period**. **Gondwana sequence sabse latest (nayi) hai** — Vindhyan, Cuddapah, Dharwar se baad ka. India ka zyadatar coal Gondwana region se hi milta hai. (J.D. Dana ka 'Manual of Geology' America ke geology ka source hai, India ka nahi — ye ek confusion trap hai). [Q12, Q13]

3. Landform Formation — Synclinorium, Foredeep & Plate Theory

- Meghalaya plateau structurally Deccan (Peninsular) plateau ka extension hai. Kashmir Valley ek **synclinorium** mein bani thi. Gangetic plain/Indo-Gangetic depression ek '**fore-deep**' hai jo Himalaya ki high crust-waves ke saamne bana — isi wajah se Ganga plain ko '**geosyncline**' bhi bola jaata hai (pediplain/peneplain/karst plain NAHI). [Q6, Q14]

4. Coastline, Geological Rock Ages & Miscellaneous Facts

- India ka geologically sabse ancient part **Peninsular region** hai; Himalaya sabse newly-developed folded mountain hai. **Western coastline nadi-deposition se NAHI bani** — balki land ke submergence-emergence (dhab jaana-ubharna) se bani hai (ye ek common wrong-statement trap hai). [Q7]

⚠ EXAM TRAP — Western coast ki origin — submergence/emergence, NOT river deposition

5. Region-Specific Features (Uttarakhand, Bihar, Kerala, Thar Desert)

- Artesian wells (jinme paani nikalne ke liye pump nahi chahiye) Uttarakhand ke **Tarai region** mein milte hain. [Q5]
- Bihar mein **Dharwar geological formations** Munger, Nawada aur Jamui (South-East Bihar) districts mein milte hain — **Rohtas mein NAHI** (Rohtas South-West Bihar mein aata hai jahan Vindhyan-type formation hai). [Q11]
- Kerala ka **Kuttanad (Kuttanadu)** region India ka **sabse kam altitude wala area** hai — samudra tal se 1.2-3.0 meter neeche farming hoti hai. Isi wajah se ise 'Rice Bowl of Kerala' bhi kaha jaata hai, aur FAO ne ise globally-important agricultural heritage declare kiya hai. [Q9]
- Sindhu/Indus Valley area ek desert region hai (NW Punjab/Pakistan aur adjoining Thar desert). **Bharatiya (Indian/Thar) marusthal** Aravalli hills ke **western margins** par hai, jahan saalana rainfall **150mm se kam** hoti hai, aur **Luni** iss region ki ekmatra badi river hai. [Q10, Q15]
