

The Atmospheric Pressure — FULL MIND MAP

Topic-wise · Fully Explained · Hinglish · SSC / BPSC / BSSC / Railway

Chapter 39_The_Atmospheric_Pressure

Topic Index

1. Sub-Polar Low-Pressure Belt (60-65°)
2. Horse Latitudes
3. Air Pressure — Seasonal Variation

Sub-Polar Low-Pressure Belt (60-65°)

- Dono hemispheres mein 60°-65° latitudes pe **low-pressure belt** hoti hai high-pressure ki jagah (A TRUE) — **R bhi TRUE hai lekin sahi explanation NAHI** (asal reason: Northern Hemisphere mein 60°N ke around bade landmass ki wajah se belt ki continuity disrupt hoti hai; Southern Hemisphere mein vast ocean + kam landmass ki wajah se belt zyada pronounced/stable hoti hai — 'low-pressure areas stable over oceans' statement khud sahi hai lekin A ko explain nahi karta). [Q1]

Horse Latitudes

- **Horse Latitudes** = ~30°-35° N aur S dono latitudes (Equator se) — **high-pressure belts** hain (subtropical high), low-pressure NAHI. Equatorial air rise hoke poles ki taraf deflect hoti hai (Earth's rotation se), cold+heavy hoke yahan descend karti hai — calm/weak/variable winds. Naam 'Horse Latitudes' ka origin: purane time mein horse-carrying ships in calm zones mein struggle karte the, ships lighten karne ke liye kabhi kabhi horses samundar mein fenke jaate the. [Q2, Q3]

EXAM TRAP

- Horse Latitudes **high-pressure** belts hain, low-pressure NAHI — yeh common confusion hai. [Q3]

Air Pressure — Seasonal Variation

- Air pressure sabse kam **Summer season** mein hoti hai (temperature aur pressure inversely related hain, summer mein temperature highest hoti hai) — altitude badhne se temperature+pressure dono ghatte hain. [Q4]
